De useful 101 controlled to compounds with a cytocact, respiratory, antinflammatory, anabolic, hypertensive, endocrine-Gen, gastrointestinal-Gen, pypertensive, osteopathic, nootropic, antinflammatory, anabolic, hypertensive, osteopathic, nootropic, antinflammatory, antiseborrheic or derabological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be useful for gene therapy. The BSS-42 polypeptide or polymucleotide can be used for diagnosing a pathological condition or a susceptibility to a pathological condition or a susceptibility to a pathological condition when as a disorder related to aberrant cubulin ligase activity, a disorder related to aberrant tubulin.

Carboxypeptidase activity, aberrant cellular proliferation, reproductive disorders, testicular disorders, testicular cancer, pulmonary disorders, lung cancer, gastrointestinal disorders, colon cancer, stomach cancer, neural disorders, brain cancer, liver cancer, or proliferative condition of the testis, lung, small intestine, brain or lymph tissue. The BGS-42 polypeptide can be used as a preventive agent for immunological disorders including arthritis, asthma, AIDS, sepsies, acromegaly, Alzheimer's disease, or Parkinson's disease or scleroderma. The BGS-42 polypeptides are the present sequence is that of the human to segment the BGS-42 protein (partial sequence) of the invention. This invention relates to a novel testis-specific tubulin tyrosine-ligase -like polypeptide, designated the BGS-42 polypeptide. The invention may be useful for the development of compounds with a cytostatic, respiratory

Example 4; SEQ ID NO 13; 343pp; English.

This invention relates to a novel testis-specific tubulin tyrosine-ligase

-like polypeptide, designated the BGS-42 polypeptide. The invention may

be useful for the development of compounds with a cytostatic, respiratory,

den, gastrointestinal-Gen, neuroprotective, endocrine-Gen,

antiparkinsonian, antiarthritic, antiasthmatic, anti-HIV, antibacterial,

antiparkinsonian, antiarthritic, antiasthmatic, anti-HIV, antibacterial,

imminosuppressive, antiseborinteic or dermatological activity acting as

tyrosine ligase modulators. In addition, the disclosed sequences may be

useful for gene therapy. The BGS-42 polypeptide or polymucleotide can be

useful for dagnosing a pathological condition or a susceptibility to a

pathological condition in a subject, and for preventing, treating or

meliorating a medical condition, such as a disorder related to aberrant

cubulin ligase activity, aberrant cellular proliferation, reproductive

carboxypeptidase activity, aberrant cellular proliferation, reproductive

disorders, testicular disorders, testicular cancer, pulmonary disorders,

lung cancer, gastrointestinal disorders, colon cancer, stomach cancer,

neural disorders, brain cancer, liver concer, pulmonary disorders,

cueval for preptide can be used as a preventive agent for immunological

disorders including arthritis, asthma, AIDS, sepsies, acromegaly, Alahaimer's disease, or Parkinson's disease, or

disorders including arthritis, asthma, AIDS, sepsies, acromegaly, Alahaimer's disease, or Parkinson's disease or scleroderma. The antibodies may be used to purify, detect and

target the BGS-42 polypeptides. The present sequence is that of the

target the BGS-42 polypeptides. The present sequence is that of the

exemplification of the invention.

parnological condition in a subject, and for preventing, treating or ameliorating a medical condition, such as a disorder related to aberrant tubulin ligase activity, a disorder related to aberrant tubulin-carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive configurates, testicular disorders, colon cancer, plumonary disorders, lung cancer, plumonary disorders, colon cancer, stomach cancer, neural disorders, brain cancer, liver cancer, or proliferative condition configuration polymeptide, polymelectide, or their modulators are also useful for treating infertility, Cushing's syndrome, emphysema, pneumonia, Addison's collesse, acromegaly, Alzheimer's disease, or Parkinson's disease. The BGS-42 polymeptide can be used as a preventive agent for immunological disorders including arthritis, asthma, AIDS, sepsis, acne, Sjogren's disease or scleroderma. The antibodies may be used to purify, detect and target the BGS-42 protein of the invention.

This invention relates to a novel testis-specific tubulin tyrosine-ligase-like polypeptide, designated the BGS-42 polypeptide. The invention may be useful for the development of compounds with a cytostatic, respiratory-Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen, antinflammatory, anabolic, hypertensive, osteopathic, nootropic, antiparkinsonian, antiarthritic, antiasthmatic, anti-HIV, antibacterial; immunosuppressive, antiseborrheic or dermatological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be useful for gene therapy. The BGS-42 polypeptide or polynucleotide can be used for diagnosing a pathological condition or a susceptibility to a

De userul for the development of compounds with a cytocatic, tespinatory cantinflammatory, anabolic, hypertensive, endocrine-Gen, antinflammatory, anabolic, hypertensive, osteopathic, nootropic, antinflammatory, anabolic, hypertensive, osteopathic, nootropic, antinflammatory, anabolic, hypertensive, osteopathic, nootropic, immunosuppressive, antiseborrheic or dermatological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be useful for gene therapy. The BGS-42 polypeptide or polymucleotide can be used for diagnosing a pathological condition, and so a disorder related to aberrant tubulin ligase activity, a disorder related to aberrant tubulin ligase activity, a disorder related to aberrant tubulin ligase activity, aberrant cellular proliferation, reproductive disorders, testicular disorders, colon cancer, pulmonary disorders, lung cancer, gastrointestinal disorders, colon cancer, stomach cancer, neural disorders, brain cancer liver cancer, or proliferative condition of the testis, lung, small intestine, brain or lymph tissue. The BGS-42 polypeptide, polymucleotide, or their modulators are also useful for treating infertility. Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromagaly, Alzhaimer's disease, or Parkinson's disease. The BGS-42 polypeptide can be used as a preventive agent for immunological disorders including arthitis, asthma, AIDS, sepsis, acne, Sjogren's carget the BGS-42 polypeptides. The present sequence is that of the Tillity domain of the human BGS-42 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel testis-specific tubulin tyrosine-ligase -like polypeptide. The invention may be useful for the development of compounds with a cytostatic, respiratory

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective; osteopathic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiathritic; immunosuppressant; immunostimalant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; coaquences can be used for determining the presence of or predisposition cartivital; antithematic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be cused to treat cancers, proliferative disorders, neurodegenerative casoriated clasorders, osteoarthritis, graft vs host disease, cardiovascular disease, catorage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), ALDS, vital, bacterial or fungal infection, malaria, autoimmune cating damage, nocturnal haemcoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive
                                                                                                  open reading frame; ORFX; detection; cytostatic; hepatotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous sinjuries, peripheral nervous and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral socierosis, and Shy Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and part of the printed specification
 immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                               Sequence 352 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 7

This invention relates to a novel testis-specific tubulin tyrosine-ligase completed designated the BGS-42 polypeptide. The invention may be useful for the development of compounds with a cytostatic, respiratory. Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen, antiinflammatory, anabolic, hypertensive, osteopathic, nootropic, antiinflammatory, anabolic, hypertensive, osteopathic, nootropic, antiinflammatory, anabolic, hypertensive, activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be immunosuppressive, antiseborrheic or dermatological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be useful for gene therapy. The BGS-42 polypeptide or polymucleotide can be used for diagnosing a pathological condition or a susceptibility to a pathological condition, such as a disorder related to aberrant tubulin-carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptides activity. Semall intestine brain or lymph tissue. The BGS-42 polypeptide, polymucleotide, or their modulators are also useful for treating infertility. Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromegaly, Alzheimer's disease, or Parkinson's disease. The BGS-42 polypeptide can be used a preventive agent for immunological disease a succepted the BGS-42 polypeptides. The present sequence is that of the human configurable. The present sequence does not appear in the specification but was obtained from
                                                                                                                                                                                                                                                e.9
                                                                                                                                                                                                               New testis-specific tubulin tyrosine-ligase-like BGS-42 polypeptide, useful for preventing, treating or ameliorating a medical condition, eaberrant cellular proliferation, reproductive disorders or testicular
                                                                                                                                                                                                                                                                                                                                              Disclosure; SEQ ID NO 7; 343pp; English.

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and echods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies antagonists, binding molecules and compositions are useful concreased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia TAT nucleic acids may further be used as hybridisation probes, in ornowseeme and gene mapping, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 TKFDIRQWFLVTDWNPLTIWFYKESYLRFSTQRFSLDKLDSAIHLCNNAVQKYLKNDVGR 120

Sequences AAF21614 - AAF22011 represent DNA sequences encoding human proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonists sequences exhibit cytostatic; immunosuppressive; nootropic; antiinflammatory; antiviral; antiallergic; hepatotropic; antidiabetic; untilingal; antiparasitic and cardiant activity. The polymucleotide and protein sequences are used in the diagnosis of cancer, particularly antients and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune

This invention describes a novel disease detection and treatment molecule polypeptide (MDDT) which has anti-inflammatory, immunosuppressive, osteopathic, cytostatic, anti-HIV, haemostatic, nephrotropic, antianaemic, antipsoriatic and hepatotropic activity. The polymucleotides and the polypeptides of the invention can be used for gene therapy, protein replacement therapy and are useful for treating a variety of diseases or conditions. These polypeptides or polymucleotides are particularly useful for diagnosing, treating or preventing cell proliferative disorders (e.g. cancers including adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma or sarcoma, anaemia, crohn's syndromes (ALDS), Goodpasture's syndromes, inflammation, osteoporosis, thrombocytopaenia, psoriasis or hepatitis. ABUI1450-ABUI1045 represent the MDDT polymucleotides encoded the sequence data for this patent did not form part of the invention. NoTE: The sequence data for this patent did not form part of the printed general part of the printed procession, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytoskeleton-associated protein; CYSKP; autoimmune disorder;

The invention relates to human cytoskeleton-associated polypeptides

C (CYSKP) and their associated polymuclectide sequences. The sequences are
useful in the treatment of disorders associated with overexpression or
underexpression of CYSKP in a patient. The disorders include cell

C underexpression of CYSKP in a patient. The disorders include cell

c underexpression of CYSKP in a patient. The disorders include cell

c arteriosclerosis, cirrhosis, hepatitis and psoriasis),

c autoimune/inflammatory disorders (such as, atherosclerosis,

c costeoporosis, Crohn's disease, rheumatoid arthritis, diabetes mellitus

c and anaemia), vesicle trafficking disorders (such as

c disorderstinal disorders, prion diseases, neurological disorders (such

c as epilepsy, stroke, cerebral neoplasms, Alzheimer's disease,

thutington's disease, Parkinson's disease, amyotrophic lateral sclerosis

c and other motor neuron disorders), cell motility disorders, reproductive

cc disorders (such as endometriosis and polycystic ovary syndrome), muscle

disorders (such as myocarditis, migraine, hypertension, hypoglycaemia,

c disorders (such as myocarditis, migraine, dystrophy, spinal cord

diseases, central nervous system disorders (such as bown syndrome and

c rerebral palsy) and mental disorders (such as anxiety and schizophrenia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification, where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprisents to the
complementary strand of a polynucleotide omprises one of the 5602
nucleotide sequences defined in the specification, where the
complementary strand of a polynucleotide which complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide comprises a 1'-end sequence, where the
complementary strand of a polynucleotide comprises a 1'-end sequence, where the combination of
complementary strand of a polynucleotide sand the complementary to a
coligonucleotide comprises at least 15 nucleotides and the combination of
coligonucleotide comprises at least 15 nucleotides and the combination of
coligonucleotide comprises at least 15 nucleotides and the combination of
coligonucleotide which comprises at least 15 nucleotides
coligonucleotide comprises at least 15 nucleotides
coligonucleotide comprises at least 15 nucleotides
coligonucleotide comprises at least 15 nucleotides
coligonucleotides
complementary to a primer sets can be used in antisense therapy and in
coligonucleotides. The primers allow obtaining of the full-length
coligonucleotides
complementary to the
complementary to a
complementary to complementary to complementary
coligonucleotides

                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM6502-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM01378 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaccutical agents. The present sequence represents a protein sequence of the invention.

cantinflammatory, anabolic, hypertensive, endocrine-Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen, denigate antiparthic, antiasthmatic, antiathmy, antibacterial, immunosuppressive, antistrhmitic, antiasthmatic, noctropic, antiparthinsonian, antisteborrheic or dermatological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be useful for gene therapy. The BGS-42 polypeptide or polymucleotide can be used for diagnosing a pathological condition or a susceptibility to a pathological condition or a susceptibility to a meliorating a medical condition, such as a disorder related to aberrant tubulingase activity, a disorder related to aberrant tubuling carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidases activity, aberrant cellular proliferation, reproductive corboxypeptidases activity, aberrant cellular proliferation, reproductive carboxypeptidases activity, aberrant cellular proliferation, reproductive corporates, brain cancer, liver cancer, or proliferative condition cancer, agastrointestinal disorders, control and sisorders, brain cancer, or proliferative condition cancer treating infertility, Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromegaly, Alaheimer's disease, or Parkinson's disease. The BGS disease, or payeride can be used as a preventive agent for immunological disorders including arthritis, asthma, AIDS, sepsis, acne, Sjogren's carget the BGS-42 polypeptides. The present sequence is that of the human corporate the BGS-42 polypeptides. The present sequence is that of the human corporation which is related to the invention but was obtained from

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Patent No. 6703491

GENERAL INFORMATION:
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILE REFERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --- QQYYSLVHGDAFISNSRNYFSQC
